EJP Maschinen GmbH Germany

EJP expands in the International Wire Industry

In December 2020 we acquired a substantial share in Italmec Sp. z o.o. from Katowice in Poland. Thus, the EJP Group completes its product range with wire drawing machines for ferrous wires and offers complete production lines from a single source for the entire process chain from wire rod to finished coil.

Already in spring 2020, EJP founded EJP Wire Technology together with Lothar Köppen, which supplies machines and the related process technology for the pretreatment of wire. At the same time, EJP entered into a cooperation with the Polish machine maker Italmec for the marketing of wire drawing lines.

The cooperation has developed so positively, that Italmec is now a member of the EJP Group. Also completed in January is the shareholding in WWM Technology Srl. in Conselve/Padua in Italy, which is since decades specialized in making of the full product range for the production of welding wires.

In the wire division of the EJP Group, we now combine German engineering with production in Katowice. From now on, we supply all machines for the complete process chain of wire production with modern technology and in the best quality at very attractive prices.

The EJP Group: Competent in wire, bars, tubes and profiles

EJP Wire Technology in Schwerte in Germany manufactures equipment for wire pretreatment, Italmec produces drawing machines and peripheral equipment, EJP Tosca supplies shot blasting equipment, EJP Italia provides Butt Welding equipment for wire and WWM continues to focus on machines for the production of welding wire.

EJP Maschinen GmbH continues to produce machines for the manufacture of bars, tubes and profiles and coordinates worldwide sales and service activities.

"There were many changes in the international market in 2020. Through the participation in Italmec and WWM, we are filling a gap that was created last year. In the wire industry, we are now one of the few suppliers that produce complete plants for the entire 'wire' process chain and at the same time have a global sales and service network. We also utilize synergies between the wire industry and our traditional focus on 'bars, tubes and profiles', as many of our customers produce both wire and other long products."

Jacques Paraskevas

Italmec Sp. z o.o. remains the production site for all wire drawing machines - both for low and high carbon steels such as spring wire.

The company founder and shareholder Daniele Costantin and Thomas Voss as sales manager are the competent contact persons.
